

Introduction

This package contains different demo scenes for each Render Pipeline, which are located in a separate folder. Simply open the folder with the corresponding name, where you can find the demo scene:

- *Built-In* - if you use *Built-In*;
- *URP* - if you use *URP*;
- *HDRP* - if you use *HDRP*.

This package includes 3 ready-to-use Black Hole effect prefabs. A video demonstrating the available configuration options can be viewed at the following link:

Video 1 – Technical demo

Requirements

This package uses *Shader Graph*, and some of its effects rely on the *Bloom* effect. If you are using the *Built-In Render Pipeline*, you will need to install both the *Shader Graph* package and the *Post Processing* package in *Package Manager*.

To ensure the shaders work correctly, make sure HDR is enabled in your graphics settings.

Shaders

For performance reasons, procedural noise is not used in this package. All shaders rely on pre-rendered noise textures and images.

BlackHole

This shader creates a Black Hole effect by shifting the texture horizontally in the center of the object and twisting it around the edges.

Parameters:

- *Texture* – base texture of the effect;
- *Scale* – controls the horizontal stretching of the texture;
- *Speed* – controls the speed of the texture movement;
- *FresnelPower* – defines the width of the effect outline;
- *Color* – base HDR color of the effect;
- *Contrast* – controls the overall color contrast of the effect;
- *EdgeColor* – HDR color applied to the edges of the effect;
- *EdgeStrength* – defines how strongly *EdgeColor* influences the edges;
- *EdgeTransition* – controls the smoothness of the transition from *Color* to *EdgeColor*;
- *EdgeOpacity* – controls the transparency of the object edges;
- *RingRadius* – defines the radius of the ring in the center of the effect;
- *RingStrength* – controls the glow intensity of the central ring;
- *RadialStrength* – controls the twisting strength in the center of the effect;
- *TwirlStrength* – controls the twisting strength at the edges of the effect;
- *TwirlSize* – defines the size of the twisting at the edges;
- *TwirlContrast* – controls the contrast of the twisting at the edges.

BlackHoleCore

This shader is designed to create the core of the Black Hole.

Parameters:

- *Texture* – base texture of the effect;
- *Color* – HDR color of the effect;
- *Strength* – defines the width of the effect outline;
- *Speed* – controls the speed of the texture movement.
